KERALASE™ HAIR RESTORATION THERAPY FOR THINNING HAIR

KeraLase™ by LaseMD is a new innovative technology combining the power of the Ultra Laser treatment with the effective KeraFactor serum, allowing this multifaceted topical solution to penetrate deep into the hair follicle for a higher rate of absorption and amazing results.

LaseMD laser hair loss treatment uses a non-ablative fractional thulium laser to create “microchannels” that penetrate deep into the scalp. A proprietary KeraLase KeraFactor® serum is then massaged into the scalp, which is absorbed into the micro-channels and delivered to damaged or dormant hair follicles.

The KeraLase serum contains “bio-identical” synthetic versions of the body’s growth factors and proteins which are needed to regrow hair. The growth factors and proteins rejuvenate damaged hair follicles and stimulate increased blood supply to the dormant hair follicles. This triggers natural hair regrowth, in addition to increasing the thickness of the individual hair shafts being produced.

Unlike other hair loss treatments that sit on top of the scalp, the KeraFactor serum travels down the laser-created channels to reach the root. And, unlike other hair restoration products that only are effective during the hair follicles growth phase, KeraFactor affects all 4 stages of the hair life cycle – so it begins working to regenerate the hair follicle immediately.

KeraLase is a unique treatment for hair loss with less pain, less treatment time, and greater result
